

Release Notes for ExtraView 10.1

Date: March 31, 2016

ExtraView 10.1 Release Notes
Feature Enhancements

Issue #	Module	Title	Release Note
320239	Add & Edit	Auto-complete has been extended to work on multi-valued list and multi-valued user fields	Auto-complete, or typeahead, has now been implemented on both multi-value list and user fields. This is configured in the data dictionary in the same manner as it is configured on single valued fields.
323094	Add & Edit	Allow the user's job title to be available for display in user popups	This is a minor enhancement that allows a user's job title to be viewed in the search popup. This is configured with the behavior setting USER_POPUP_COLUMNS .
324603	File Import (GUI)	New option in the File Import Utility that prevents the checking of field level security permissions	This option has been introduced to aid in the importing of very large number of issues with the File Import utility. It is recommended that this only be considered when you are importing 10,000 or more issues, and when you, as administrator, are certain of the validity of the data within the import file. the consequences of using this option is that the time taken to import the records is decreased.
322570	General code issues	Improved the usage of the Print Page button on add/edit screens and detailed reports	Previously, when a user elected to use the Print Page button on the menubar of an ExtraView screen, the menubar was removed from the output before printing, to avoid browser problems where the menubar would be superimposed upon the top of the report. This has been improved so the menubar remains on the screen after printing.
300581	Search / Report	Improvements to the sharing of reports	There are several improvements (and bug fixes) to the ability to share reports with arbitrary groups of users within a report group. First, the Shared Reports have their own high level area within the tree of reports, joining "My Reports" and "Public Reports". In addition, some problems with the saving of shared reports have been fixed.
303163	Search / Report	The document repository supports "virtual" folders	When automatically creating documents on a frequent basis, that are added to the document repository, this features allows the transparent creation of folders for the documents, according to a convention. This convention allows the user of the day, month or year to be used in the folder name when first created. ExtraView will use the names entered to automatically create new, virtual folders as and when needed by the report scheduler. For example, a new virtual folder might be created automatically each month, so that documents are stored within folders with names such as April 2016.
308259	Search / Report	Enable the orientation of reports output as PDF	There is a new report output option, which allows reports and queries to be created in both landscape and portrait modes.
312777	Search / Report	Generate multiple copies of a container report in a single PDF	This new Container report option allows the user to take the results from

Issue #	Module	Title	Release Note
		document based on an aggregation	a summary report, and to use the field value returned in each row of the summary report, as an input filter to produce an entry in the Container report that generates output for each of these rows. For example, you might generate a list of issues reported by Country. For each Country in the summarized list, a report that uses the Country field as a filter will then be generated within the Container. This simplifies the production of Container reports that would otherwise require the creation of a separate report for each Country.
314956	Search / Report	Ability to group on multiple levels of a hierarchy filter within matrix and summary reports	This new feature applies to both summary and matrix reports. This allows the grouping of results on multiple levels of hierarchical filters by selecting a hierarchy attribute on field, and performing a count on the same hierarchy.
320745	Search / Report	Global replacement filters only replace Runtime filters	Global replacement filters now replace Runtime filters as opposed to being added to the filters within Container reports. In addition, there is the capability within the Container report editor, to ignore the replacement filters for any individual report or reports selected within the Container.
320831	Search / Report	Added the capability of adding saved filters into the filters set up for a report	Saved filters may now be inserted at any point within a report editor. If chosen from the list of saved filters, they replace all the existing filters, whereas if chosen from a new *Insert saved filters* entry in the list of fields, they will be inserted at that point in the filter list. This works with hierarchical filters as well as with one-level sets of filters.
320963	Search / Report	New ability to save Advanced Report Filters with a value of * Any * on reports	Filters with a value of *Any* were previously removed when saving a set of filters on the Query screen. They are now preserved, which makes it simpler for users setting up complex filters and making use of saved filters. Now the filters with a value of *Any* are placed into the user's advanced filters, where they can then select appropriate values, without the need to find and insert the filter from the field list.
323311	Search / Report	Provide sort capability on matrix report for statistical results	The Min, Mean, Max, Total and Percentage columns on the browser output of a matrix report may now be sorted, by the user clicking on the column title. In addition, there is a select list within the report editor which allows the user to select one of statistical columns and use that to sort the initial output when running the report to either ascending or

			descending.
323408	Search / Report	Provided ability to specify which statistics to add to a matrix report	Matrix reports now offer the ability to select which statistics are added to the report output. The user may independently select Min, Max, Mean, Total and Percentage. In addition, the user may change the title of the option on the report, and set the precision of the displayed result.
320817	Workspace GUI	Running a container report no longer requires a separate window when in workspace mode	This now works by a new panel opening within the workspace, as opposed to a new browser tab / window.
			Count: 15 records

ExtraView 10.1 Release Notes
Fixed Bugs

Issue #	Found in Release	Module	Title	Release Note
324722	10.0.2	Add & Edit	Tabbing through fields on an add / edit screen did not stop at the new style "box" radio buttons	This was omitted within the original implementation, and has now been fixed.
322501	10.0	Search / Report	Container Report display problem	This problem was traced to the text originally being copied and pasted from MS Word. Word substitutes a long hyphen for a normal hyphen while editing, and this character was not compatible with the PDF rendered. The problem has been fixed.
322779	10.0	Search / Report	Hierarchy Report with repeating row filters did not display results	When a hierarchical report had repeating row filters on multiple levels of the hierarchy, no results would be displayed. This has been fixed.
322781	10.0	Search / Report	Hierarchy Report - checking box "show parents without children" caused an error	When running a hierarchical report that checked the "Include parents without children" option, an error was generated, causing the report to not run. This has been fixed.
323259	9.0.3	Search / Report	Scheduled Reports with "Merged Excel File" output are created without .xlsx extension	Scheduled Reports that used the "Merge with Excel File" generated the wrong file extension and could not be read within email clients. This has been corrected so that the extension is now .xlsx

Count: 5 records
