Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
260198	Product Bug	6.6.1	Administration	Administrative changes to user's profiles occasionally were not saved upon update	This was an obscure bug, caused by users changing their user role, default area or default project during normal operations, and an administrator then changing the user's account information before the user's changes had been saved to the database, and were only cached. There was a small window of time when the administrator could save their information, but it would not "stick" because the user had changed the same information. This has been fixed.
259885	Product Bug	7.0.9	BatchMail	BatchMail task was stopping unexpectedly	If the mail port specified in the BatchMail task was configured to have a default value, a new check introduced into the code did not handle this properly and would get in an error condition. There was a simple workaround to provide the actual port number in the configuration (usually this has a value of 25), but the problem has been fixed.
259870	Product Bug	N/A	LDAP	LDAP upsert failed when signing on with LOGIN_ID	This was fixed
