7.0.11 Release Notes

Prepared - 12/4/12 4:17 PM

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
262784	Feature Enhancement	N/A	Administration	Created means to allow condensed or expanded filters on embedded search layout	There is a new layout cell attribute named LAYOUT SEARCH EXPANDED MODE that can be applied to embedded search layouts on add and edit screens. When this attribute is set, the search layout is rendered in expanded search mode, as opposed to condensed search mode. This allows users to make multiple selections for filters when searching for items to relate to the current issue.
261128	Feature Enhancement	N/A	Business Rules	Extended link business rules to handle additional hierarchy levels	When you create a business rule with a LINK directive, you specify a parameter of RGTYPE to determine the relationship type. Traditionally, these have supported CHILDREN, GRANDCHILDREN, PARENTS and GREATGRANDPARENTS. Additional levels have been added to the capabilities, allowing GREATGRANDPARENTS, GREATGRANDCHILDREN, GREATGREATGRANDPARENTS and GREATGREATGRANDCHILDREN to be used in the link rules
260959	Feature Enhancement	N/A	Relationships	Allow embedded search layouts to handle repeating row filter fields	This enhancement allows repeating row fields to be used as filters when they are used within search layouts embedded within add and edit screens
261090	Product Bug	7.0.9	API & CLI	No error message after an unsuccessful attempt to use API update	This happened when attempting to add new repeating records via the API using the "update" command. If the update was not successful, no error was generated. This has been fixed.
261132	Product Bug	7.0.5	Add & Edit	"Waiting for a response from the server" error message observed, due to Ajax refreshes	This was caused by an untrapped JavaScript bug. When the code ran through the routine with the bug, it would wait for a response that never came. This has been fixed.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
261910	Product Bug	7.0.5	Add & Edit	Visible If attribute caused the mouse cursor focus to move to the top of screen	This was caused by a bug within search layouts embedded into an add or an edit screen, whereby a field introduced into a form with a visible if attribute would have the wrong HTML "tabindex" value. This caused the cursor to jump to the beginning of the form. This has been fixed.
262946	Product Bug	7.0.4	Add & Edit	Error "null while processing ID#nnnnn" when editing an issue	This problem was localized to the processing of fields which had a "Display as URL" data dictionary attribute. The problem was intermittent and only affected a small number of users. The problem was fixed.
262281	Product Bug	7.0.10	Administration	Password did not expire correctly	This has been fixed, so that the new password takes effect upon the next sign on after expiry, by the user
262423	Product Bug	7.0.10	Administration	A change to a user's role would occasionally revert to its previous value	This was an obscure problem and happened as a result of an administrator updating an account and during that period, the end user changed his/her role from the prompt on their Home Page. For this problem to emerge, the behavior setting SAVE_ROLE_CHANGES had to be set to NO. The problem has been fixed.
258836	Product Bug	6.5.1.5	Business Rules	Changes to Data Dictionary cause Business Rules refresh	After an administrator updated the data dictionary to modify a field, the next user who accessed an add or edit screen would notice a considerable delay. This was due to the Business Rules being marked as stale by the data dictionary operation, and needing to be recompiled. On almost all sites, this delay would not be noticed, but on a handful of sites with very large numbers of Business Rules, the delay would be very noticable. Now, the data dictionary only marks the Business Rules as stale if it is doing an operation which will certainly lead to complications.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
263017	Product Bug	7.0.2	Business Rules	Business rules change would not update database	This problem occured on a site where there were more than 2,000 rules within a single business area. The issue was resolved by approximately doubling the amount of rules that could be handled by the client browser code before the same issue would be encountered. There is a hard limit within the browser for this type of operation, but it is not likely that users will encounter this limit.
263266	Product Bug	7.0.5	Business Rules	Unable to pull currency data across link directive business rule	If you constructed a link directive rule that pulled a currency or decimal display type field value from another issue into a currency field on the current issue, an exception was seen in the application log, and the field was not populated into the current issue. This has been fixed.
261582	Product Bug	7.0	Database	Database rows in the image_item_udf_temp table were not cleaned up	This led to a minor performance problem when using IMAGE display type fields. The problem has been resolved.
263625	Product Bug	7.0.3	Database	Table or view does not exist message displayed with Oracle 11g	Some installations reported seeing a message "ORA-00942: table or view does not exist".

This message originates in versions of the Oracle database only and did not appear with other databases used with ExtraView. The underlying cause was a bug within Oracle. Oracle reports that this bug existed within versions 11.2.0.1, 11.1.0.7, 10.2.0.5, and 10.2.0.4 on all platforms.

The fix is to upgrade your Oracle database to version 11.2.0.2 or higher, or to apply a patch you obtain direct from Oracle to earlier versions. |
| 262089 | Product Bug | 7.0.5 | Notification | Repeating row data was not being displayed in email notifications | This occured when the repeating layout was embedded within another layout, and that layout was embedded within the email notification layout. The problem has been fixed |

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
263271	Product Bug	7.0.9	Search / Report	Matrix report failed after upgrading to version 7.0.9	Matrix reports could fail with certain configurations. This only occured in installations where a user role had read and write access to every PROJECT. This was fixed.
263139	Product Bug	7.0.5	XML Import and Export	Failure to import scheduled report from an XML migration file	This occured with a report which used the "Run As Owner" as an option. The problem has been fixed.
Count: 17 records
