

Release Notes for ExtraView 9.0.1

January 12, 2015

Feature Enhancements			
Issue #	Module	Title	Release Note
304163	EV Mail	EV Mail parsing enhancement	If the defined "target" field in the EV Mail configuration is an HTML Area field, that we now pass through the HTML tags within the incoming mail to the field, so that the field retains the original HTML tags that were sent.
303543	Layout Rendering	Ability to select all values at once in a multi-valued list field	<p>There is now an option to Include a *Select All* special value at the top of each multi-valued list field similar to the way the *None* and *Any* special values are rendered. Clicking the *Select All* value causes an immediate selection of all values in the list, as well as triggering any onchange events configured on the field.</p> <p>In the Design Center, a new layout cell attribute is implemented to disable the *Select All* special value, in the same way that the REMOVE NONE and REMOVE ANY layout cell attribute work with the *None* and *Any* special values, respectively.</p>
299943	Search / Report	FILTER_CHILD_VALUES user selectable option is now available with Advanced Queries	With the behavior setting FILTER_CHILD_VALUES set to USER, there is now an option with Advanced Queries to filter the child values.
Count: 3 records			

Fixed Bugs				
Issue #	Found in Release	Module	Title	Release Note
303518	8.1	Add & Edit	User was unable to create an HTML table in an HTML Area field, using the new table button	This was traced to two different JavaScript files used within ExtraView (one being a 3rd party utility) both using the same function name for different purposes. This has been fixed.
305277	9.0	Business Rules	Refresh business rules for multi-valued list fields did not work in 100% of cases	The parent-child rule dependency was not being set for xxx.{changed} rules in some cases. This has been fixed.
302555	9.0	EV Mail	Attachment problem with .msg file	Inbound email attachments with mime type message/rfc822 often have no file name associated with them. In that case, a file name is generated as "rfc822Message.eml" (with mime type of message/rfc822).
305255	8.1.3	History	Timestamp should not be used as a target mapped field within the File Import Utility	The TIMESTAMP field value for issues should not have been permitted to be overwritten by a mapping within the File Import Utility. ExtraView needs to manage the value of this field itself. To prevent this, an administrator can no longer map a value to the TIMESTAMP field within the file import.
301264	8.1.3	Search / Report	Issue when scheduling a report with merged Excel template	<p>If the user uploaded an Excel XLS file to a report and ran the report manually, ExtraView outputs an XLS file with the merged data and all is well. However, if you subsequently schedule that report, the output generated when the scheduler runs the report, renamed the output file with an extension of XLSX and sent that. This did not work, because Excel could not open the file that is of type XLS and named XLSX.</p> <p>This was fixed.</p>

Fixed Bugs

Issue #	Found in Release	Module	Title	Release Note
301264	8.1.3	Search / Report	Issue when scheduling a report with merged Excel template	<p>If the user uploaded an Excel XLS file to a report and ran the report manually, ExtraView outputs an XLS file with the merged data and all is well. However, if you subsequently schedule that report, the output generated when the scheduler runs the report, renamed the output file with an extension of XLSX and sent that. This did not work, because Excel could not open the file that is of type XLS and named XLSX.</p> <p>This was fixed.</p>
303017	7.0.14	Search / Report	Report ran for a long time and timed out	<p>A customer reported that a query timed out when running within an IE browser, and took a very long time before returning results in other browsers. The query involved 3 filter list fields and a date with "between" as an operator. The query ran fine when the database was imported to a different instance using a different Oracle version. The problem was identified to be a known bug within the Oracle software.</p> <p>As of Oracle 11g version 2, the <code>_optim_peek_user_binds</code> no longer needs to be set to false because Oracle fixed its "no more data to read" bug. This particular flag appears to cause major optimization problems on 11g version 2 with the particular query being ran.</p> <p>We have patched ExtraView to work around the problem.</p>
304062	9.0	Search / Report	Invalid column index when running saved report with hierarchical filters	<p>This occurred in a hierarchical report where "include parents without children" was selected as an option, and filters were applied at the child as well as the parent level. This has been fixed.</p>
304772	9.0	Search / Report	Incorrect syntax near causing SQL Exception in MSSQL and Oracle databases when using repeating row filters	<p>When using a combination of <code>ad/or</code> operators with 3 or more repeating row fields in a query, there was an exception due to badly formed SQL. This has been fixed.</p>
302973	7.0.4	Sign On	With SSO enabled, users were prompted to provide a password	<p>This has been fixed.</p>
304900	8.1.3	XML Import and Export	Business Calendar issue after an XML import	<p>After an import of an XML an installation which used custom holiday entries within the business calendar ended up with a New Year's Day holiday appearing on January 2nd, not January 1st. This has been fixed.</p>
