

## Release Notes for ExtraView 9.0.2

February 27, 2015

Feature Enhancements			
Issue #	Module	Title	Release Note
Count: 0 records			

Fixed Bugs				
Issue #	Found in Release	Module	Title	Release Note
305435	9.0	Database	Permissions on user profile fields were incorrect after upgrade to 9.0	This was corrected in the database upgrade to 9.0.2
306188	9.0.1	EV Mail	EVMAIL body update lost the "From:" information when configured to direct the email body to an HTML type field	This has been fixed.
305763	9.0.1	Notification	ExtraView was unable to send standard notifications when including attachments in outbound email	This only occurred with users who had the "Guest" role. This has been fixed.
305867	8.0.4	Notification	Email notifications failed to send with a specific repeating row configuration	No email notifications were sent for HTML Area fields, or fields in repeating rows were sent, when the behavior setting EMAIL_NOTIFY_USERS_ALWAYS was set to a value of NO. This was fixed to correctly recognize changes in these fields so email notifications would be generated.
305633	8.1.3	XML Import and Export	Metadata export containing fields with allowed values using child fields of display type user were not being exported correctly	This happened when the XML export had the option to minimize the User data set, and the child in the allowed value relationship was a user field. When the user in relationship was disabled under these circumstances, there was insufficient information to correctly export the allowed values. This has been fixed.
306481	9.0.1	XML Import and Export	java.sql.SQLException: Incorrect syntax near the keyword 'COLLATE' was observed when customer performed an XML Import	This only occurred with SQL Server installations, where ExtraView was looking for case sensitivity in a "where is null" case. This has been fixed.
