

6.3.1 Release Notes

Prepared - 1/13/10 12:08 PM

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
165502	Feature Enhancement	N/A	Add & Edit	Ability to disable warning message caused by inactive UDF list values	DISABLE_INACTIVE_UDF_WARNINGS is a master controller of the warning message. If it's set to YES we ignore the warning generated when a stale value is set within an issue. We use the values from the allowed value setting if this behavior setting is not set to YES.
162282	Feature Enhancement	N/A	Administration	Extended decimal display field type allows display of % symbol	The data dictionary now allows a new attribute for decimal field types to be defined. This allows the formatting of a decimal field with a percentage sign.
128068	Feature Enhancement	N/A	EV Mail	Provide a better mechanism to eliminate original text from email replies within EVMail	A new mechanism has been created that is independent of all email clients to allow the suppression of the original email when replying to an email notification generated by ExtraView. The EVMail client can now reliably append only the new entry to a comment in the ExtraView issue when updating the issue.
162437	Feature Enhancement	N/A	Layout Rendering	New administrative option to edit issues within a modal window	This new option allows an edit session initiated by using an Edit button on a related issue display to use a modal window within the current window, as opposed to using a new window. This provides access control to a parent issue while a child issue is being edited.
163486	Feature Enhancement	N/A	Layout Rendering	New mechanism to allow screen titles to be populated from the layout description name	The title for add and edit screens has traditionally been taken from the title to the data dictionary entry for the ADD_PROBLEM, ADD_PROBLEM_SUMMARY and EDIT_ISSUE_SUMMARY fields. These entries are global. In order to provide different titles for different layouts, you can define a title in the data dictionary of \$\$LAYOUT.TITLE\$\$\$. Once this has been done, the title is displayed using the title to the layout, not the data dictionary entry, allowing a separate title to be defined for every add and edit screen in the system.
164896	Feature Enhancement	N/A	Layout Rendering	New option to edit issues within a modal window	A new layout cell attribute has been created that allows a user who opens an issue for editing via an EDIT_BUTTON on a related issue display, to open the issue within a popup, modal window. This prevents the user from modifying the underlying parent issue while editing the related issue.
165235	Feature Enhancement	N/A	Layout Rendering	Create new custom display type field for shaded regions	This new feature allows two custom fields to be defined using the convention of SHADE_PRE_xxx and SHADE_POST_xxx. When these are placed on layouts, all the rows between the fields will be provided with a colored or shaded background. The administrator can also define a legend and a style for the group of rows.

Release Notes						
Issue #	Category	Found In Release	Module	Title	Release Note	
130053	Feature Enhancement	N/A	Rules Engine	New rule feature that gets the "owner" of a value in a UDF list	All list values may have an owner defined. This allows a user associated with a specific list value to be notified automatically. A new rule qualifier has been introduced to allow this value to be read by a rule. For example the following rule will set the OWNER field within an issue to the value of the list field's owner: if (CUST_LIST.{changed}) OWNER = CUST_LIST.{owner};	
162439	Feature Enhancement	N/A	Search / Report	Implemented a mechanism to refresh Home Page reports individually	Home Page reports now have a refresh button to the right of their title. This allows each report to be refreshed individually, as opposed to refreshing the entire page	
164487	Feature Enhancement	N/A	Search / Report	Increased number of rows in a container report	Within a container report it was previously a limit to allow up to 10 rows of reports to be defined. This limit has been increased to 50 rows of reports.	
162438	Feature Enhancement	N/A	User Custom	More flexible USERNAME_DISPLAY can be customized	A new user custom exit allows the user name display to be further customized on add and edit screens. This exit is named ucTypeAheadUserNameDisplayListByTypeaheadSearchKey.	
163485	Feature Enhancement	N/A	User Custom	Provide alternative template for navigation bar	A new user custom exit has been created, allowing the entire navigation bar to be replaced with a new navigation bar defined in custom code. The name of this new user custom exit is ucNavBarReplace.	
165384	Feature Enhancement	N/A	User Custom	Ability to control attachment deletion dynamically with user custom code	A new user custom exit named ucAllowAttachmentOperation has been defined to give the ExtraView developer additional control over how and when attachments may be uploaded and managed.	
163484	Feature Enhancement	N/A	User Interface Issues	Implemented new behavior setting to swap the position of titles and buttons on screens	A new behavior setting named MENU_BUTTON_POSITION with values of LEFT and RIGHT has been created. This will swap the menu buttons and the screen title in the header and footer of the screen	
163461	Product Bug	6.2.2	API & CLI	Problems with evupload resolved	1) The -s parameter that allowed the user to upload an attachment and specify a different "created by" user, did not appear to work 2) The -a parameter that allowed the user to specify an ALT_ID instead of an ID in order to identify the ticket to attach the file to, did not work. These two issues were fixed.	
162371	Product Bug	6.1.4	Add & Edit	Multi-value list field on repeating rows caused error on update of issue	A customer experienced an error when updating a record that had a multi-select list field on a repeating row (RELEASE) layout and with an empty ({NULL}) value selected. This was fixed so no error occurs.	
164692	Product Bug	6.2.3	Add & Edit	A user list that was a child of an allowed value, used the incorrect sort order	This was related to using the behavior setting of USERNAME_DISPLAY with a value of LAST. When this was set, the sort order was using FIRST as the sort order. This has been fixed.	

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
165852	Product Bug	6.2.3	Add & Edit	Fix for Allowed Value Bug	This was an error that would only be encountered rarely, when the Global Area is being used to define allowed values, and the Global Area is not the first item in the sort sequence and the allowed value definition for a field was then altered. This was fixed.
165977	Product Bug	6.3.1	Add & Edit	Update & Prev/Next buttons did not display reliably when drilling down from Column report	This problem was resolved so that these buttons will reliably appear, assuming the user role has permission to the buttons.
165363	Product Bug	6.2.3	EV Mail	Problem with email templates and field substitutions in the subject line	Previously, substitutions for fields such as \$\$ID\$\$ only worked in the body of an email template. This has been improved so they also work in the subject line of the mail.
162352	Product Bug	N/A	General code issues	XSS vulnerability in Extraview 6.1.1	An XSS vulnerability issue was discovered whereby JavaScript could be inserted directly into the URL of a call to the ExtraView server. This vulnerability was fixed by ensuring that any JavaScript within an ExtraView URL is discarded immediately it reaches the server.
148546	Product Bug	6.2.1	Rules Engine	Order of preupdate rules processing and release record deletions processing could cause a problem	A valid configuration within an installation is to perform calculations on repeating rows and place the result within a field outside the repeating row. When a user deleted a repeating row its contents were still included in the calculation. Now, the delete is performed before the calculation, so that the result from the calculation reflects the remaining rows.
Count: 22 records
