6.5.0.2 Release Notes

Prepared - 11/8/10 3:40 PM

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
222787	Product Bug	6.5	Attachments	Add attachment popup displays blank window	This was an obscure problem that only happened on a single customer's site, where they had a very large number of fields on their add / edit screens, with many multi-valued popup fields, each containing a very large number of entries and with these entries typically having large amounts of text. The problem has been resolved.
223133	Product Bug	6.5.0.1	Performance	Chaging the value of a tab field resulted in an unacceptable delay to the end user	This was caused by Java's processing of timestamps. ExtraView was changed internally without the realization that timestamp handling with the Java Calendar object became inefficient. This has been fixed.
223289	Product Bug	6.5	Performance	ExtraView slowed and stopped responding to users	This was observed in a very heavily trafficked system with hundreds of users all sharing the same home page report. The home page report displayed many attachments for each user. This combination ate up system resources over the course of several days, causing an out-of-memory condition that required a server restart. A new behavior setting named MESSAGE_WORKER_COUNT was created to control the system resources that affected this problem.
223228	Product Bug	6.5.0.1	Rules Engine	Business rules - load directive rules are being evaluated too many times	Load rules were being executed once for each repeating row of data, as opposed to once per edit screen, causing a performance problem. This has been resolved.
223094	Product Bug	6.3.1.2	Search / Report	Different result set was observed when a user generated a chart as a saved chart and from the chart editor screen	Both methods of generating the chart were not using the same setting for expanded filters. These should always be set on for charts. This was fixed and now consistent results are seen.
223304	Product Bug	6.5	Search / Report	InvocationTargetException error when running Column report with no Sort order field and no access to ID field	This is a very unusual configuration, but prevented users with this configuration from running column reports. This has been fixed.
225126	Product Bug	6.5.0.1	Search / Report	Exception occured when sorting report results on user fields	This was a bug and was fixed. The error was observed when a user generated a column report, then clicked on the column title of a field which had a display type of user.
225232	Product Bug	6.5.0.1	Search / Report	Count was not being performed on the proper hierarchy level for pie charts in a dashboard	Charts using hierarchical filters were not displaying the correct results. This has been fixed.
223221	Product Bug	6.5	Sign On	User timeout gave the potential for a different user to access private data	If a user shared his computer with other users and left a browser window open, then once that browser window received a warning of a timeout, then it was possible for a different user to re-authenticate, but gain access to the first user's data. This behavior has been stopped so that only the original user can re-authenticate in that browser session.
Count: 9 records
