6.5.1.1 Release Notes

Prepared - 12/14/10 11:05 AM

Release Notes

Issue #	Category	Found In Release	Module	Title	Release Note
228094	Feature Enhancement	N/A	API & CLI	evusers command can now display Alternative User ID's	This allows the new alternative user ID to be used in place of the user ID, within the evusers CLI command.
225904	Feature Enhancement	N/A	Charts	FW: Chart Axis	The labels on value-based charts could be confusing when choosing two fields to chart. The Y axis label has been changed to simply say "Count" to clarify the display.
228381	Feature Enhancement	N/A	Notification	Support Document-type fields in Email Template notifications	Support for Image and Document field display types has been added to custom email templates. Now, when a custom email template is generated, any image or document field included generates the file name of the image or document as a substitute for the field tag, and the image or document is added as a file attachment to the outgoing email.
228576	Feature Enhancement	N/A	Performance	Performance improvements in handling Ajax requests	When an Ajax request was submitted for processing from an add or edit screen, there may be a significant overhead, according to the size of the layout and the number of rules and layout cell attributes in place. The processing of these requests has been speeded up.
227388	Feature Enhancement	N/A	Search / Report	Additional features implemented for the report scheduler	The report scheduler capability has been extended to include charts, matrix and summary reports. In addition, the output type has been extended so that the scheduler supports HTML, Microsoft Excel, and Microsoft Word attaced files as well as Adobe PDF.
225865	Product Bug	6.5.0.2	API & CLI	CLI -A option (anonymous access) no longer worked in version 6.5.0.2	This bug was related to the new alternative user ID capability. Anonymous access via the API no longer worked. This has been fixed.
225572	Product Bug	6.5.0.2	Add & Edit	User lookup icon failed for multi-value popup user fields with many user names selected in field	This problem only occured with Internet Explorer. When multi-valued user list popups were opened with a lage number of names selected, an error would be seen. This has been rectified.
228001	Product Bug	6.5.1	Attachments	Improved performance when displaying attachment icons	Reports which included many documents took longer to render than was expected due to error handling. The code has been improved to speed up processing.
226021	Product Bug	6.5	Database	EV_CACHE table grows excessively over time	The EV_CACHE table stores, among other items, session information for all user sessions. When ExtraView starts this table is processed to delete all user sessions as these, by virtue of restarting the server, are no longer needed. On large sites customers were reporting that this operation took a very long time, due to the table's large size. The algorithm that cleaned expired information on a routine basis has been improved, and expired user information is deleted earlier, preventing the table from growing so large and taking a long time to process at start-up time.

Release Notes

Issue #	Category	Found In Release	Module	Title	Release Note
227071	Product Bug	6.5.0.2	LDAP	ArrayIndexOutOfBoundsException occured when opening Lookup User Account Directory with LDAP_USER_LOOKUP turned on	This bug occured when the new alternative user ID was put in place, but did not work completely with all LDAP installations. The problem has been resolved.
225900	Product Bug	6.5.0.2	Layout Editor	Layout element attributes with HTML modifiers sometimes caused JavaScript error when trying to access attributes via the layout editor	This problem occured with the balloon help tips not being able to handle the display of JavaScript keywords such as "onclick" and "onchange" within the layout cell attributes. This has been fixed.
225509	Product Bug	6.5.0.1	Perforce Integration	Perforce Integration daemon service install file issue	The parameters used in the installation script to create a Microsoft Windows service with the latest Perforce integration daemon did not work under all circumstances. This has been fixed so that the Windows service can be created reliably.

227479	Product Bug	6.5.1	Rules Engine	Self referencing link directives in rules did not update the issue correctly	A link directive that is defined to match the current record (itself) being added/updated did not appear to work correctly. For example, the following postupdate rule and defined link directive should have caused the current record being added/updated to be assigned the ID value in the ALT_ID field:
					
					<== postupdate ==>
					if (ALT_ID.{null})
					{
					    {UPDATE: myselfLink ALT_ID = ID};
					}
					<== link myselfLink ==> ID
					
					This was a regression problem and has been fixed.

227727	Product Bug	6.5.0.2	Search / Report	Query filter values appeared as * None * instead of as the selected values on runtime filter screen	This was a cosmetic issue, where multi-valued lists on the popup that accepts input for runtime filters displayed *None* rather than the selected values. The report still ran correctly. The problem has been fixed.
227903	Product Bug	6.5.0.2	Search / Report	Hierarchical report never returned results and timed out	This was an issue with the SQL which caused a merge join cartesian in the query. This has been corrected.

Count: 15 records
