6.5.1.9 Release Notes

Prepared - 7/18/11 12:00 PM

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
238741	Product Bug	6.5.1.5	API & CLI	The API insert request did not create repeating row records	This problem was introduced into version 6.5.1.5 and only affected customers who used the setting ENFORCE_UNIQUE_RELEASES = YES. This is an unusual setting, and therefore most installations were not affected with the problem. This has been fixed in 6.5.1.8.
238816	Product Bug	6.5.1.3	API & CLI	If characters were appended to text field when it already had a CR/LF at the end, caused problems with the API not being able to process the field	If a text field had a CR/LF at the end, it was translated in the API to . This became a problem as the string is escaped when displayed. This affected Perforce integration users, as Perforce sometimes (not always) puts a CR/LF at the end of text fields. This has been fixed.
238368	Product Bug	6.5.1.5	Add & Edit	Ajax error upon a refresh rule being executed and an error observed in log file	The source of this problem was traced to a refresh rule on a field with a display type of popup. The field was also set with the ability to use the type-ahead functionality. When a value was selected from the type-ahead list, an error was observed on the screen, and there was an error in the application log. This was fixed.
238779	Product Bug	6.5.1.7	General code issues	LDAP errors were observed at the startup of the aplication server	Not every potential LDAP field that could be mapped was in the default Configuration.properties file. The remaining fields have been added as comments, and the original error messages have been recoded to be warning messages only.
238810	Product Bug	6.5.1.5	Rules Engine	A Link directive rule defined in the global area was not inherited by rules in any other business area	The consequence of this was that business areas would report an error upon execution of the rule that could not be found. A worksaround was to place the rule in each business area that required its use. This was repaired.
238826	Product Bug	6.5.1.7	Search / Report	Multi-valued list fields did not retain their sort on reports	This was a minor bug that was fixed.
Count: 6 records
