

7.0.6 Release Notes

Prepared - 7/26/12 8:31 PM

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
251515	Feature Enhancement	N/A	Attachments	Ability to customize file upload windows to support external document repositories	This feature allows the file upload window to be customized by the administrator to support external document repositories and file storage and sharing mechanisms such as Dropbox. This feature must be customized in conjunction with custom code that supports any desired external repository.
248567	Feature Enhancement	N/A	General code issues	New migration tool to extract documents out of the database and onto the file system	This is a new, stand-alone program named DocumentImageMigration. It will typically be run with the support of doDocumentMigration.bat or doDocumentMigration.sh. Database patches must be run with patchrunner when DocumentImageMigration has completed its work. the program disables the database triggers when it is running, so as not to create history entries for the updates it makes. For most migrations only the -migrate option needs to be performed. The size columns will already be set in the database.
254453	Feature Enhancement	N/A	General code issues	add ability to redirect to a SSO signoff url when users log off ExtraView	There is a new entry in the Configuration.properties file named SSO_SIGNOFF_URL. This must be a valid URL. This URL will replace the current ExtraView top page when any SSO user signs off. This behavior is not enabled on non-SSO systems. If the SSO_SIGNOFF_URL is blank or missing, the standard ExtraView SSO sign off page is shown.
256657	Feature Enhancement	N/A	Home Page	Change Home Page screen	The sign on message will now be visible on the Home Page for the ADMIN user account.
254840	Feature Enhancement	N/A	Notification	Provide EVMAIL_DELIMITER_TEXT as an option in outbound plain text emails	This allows better use of replies being generated from the emails, that are used to update issues in ExtraView. The inclusion of the delimiter is now an option in all email templates.
254739	Product Bug	7.0.4	API & CLI	&disabled_values=Y and &all=Y for the get_valid_meta_data API were not working correctly in conjunction with each other	When trying to get a complete metadata list, you could use the &disabled_values=Y to get those that are disabled. However, if you use the &all=Y, it was blocking getting the disabled values. You can now use these parameters independent of each other.
255736	Product Bug	7.0.3	API & CLI	API history command did not return data precisely as expected	The history screen utilized non-zero nanosecond values in the history timestamp, but the internal precision is milliseconds. So the history values were not retrieved when compared with hist_timestamp (requested timestamp <= issue timestamp). Solution was to add a millisecond to the requested timestamp.
254956	Product Bug	7.0.5	Add & Edit	Image display type UDFs on repeating rows did not allow new images to be added successfully	This bug also affected document display type fields on repeating rows. The problem has been fixed.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
253796	Product Bug	7.0.4	Allowed Values	Was unable to type or paste list value into RELEASE_FOUND field without generating an error	This was fixed
256269	Product Bug	7.0.4	Allowed Values	New behavior setting named AV_INTERSECT_WITH_NULL_PARENT	<p>This new behavior setting named AV_INTERSECT_WITH_NULL_PARENT is designed to be more permissive when identifying valid children in a multi-parent allowed value relationship.</p> <p>Some sites were taking advantage of a configuration which was deemed to be a bug, and removed, using null values as the parents in allowed value relationships. This setting provides backwards compatibility to the old behavior for those customers who want to retain the old way of working. The behavior is as follows:</p> <p>When there are multiple allowed values defined with the same child field, and one of the parents does not have any children defined when the selected value is *None*, the default behavior is to show no values in the child field, as there are no valid values for *all* parent field selected values, and the default value for this setting is NO. However, older customers may have configurations where they expect that if one of the parent selected values is *None* that this parent field is not included in the determination of which child values to display, and the child field should display the intersection of the permitted child values for the other parent(s) field(s). In this case, set this behavior setting to YES.</p>
254085	Product Bug	7.0.4	Business Rules	Could not populate the Mailing List from Repeating Rows layout field	This had never been implemented in the business rules. It now works correctly, in the same way as do fields on the main layout.
254191	Product Bug	7.0.4	Business Rules	Rule not implemented: Error observed "Task not a valid title for Project or Area"	This was an obscure problem that resulted from a business area being with the title of "Tasks" and there being a layout type with the name of "TASKS". The rules parser could not distinguish between the two names. The rules parser has been enhanced to overcome this issue
253577	Product Bug	7.0.4	EV Mail	Improve handling of email generated by Microsoft Outlook and handled by EVMail	Microsoft Outlook is often configured to use Microsoft Word as its editor. As a consequence, the HTML generated by outgoing emails often contains a huge amount of style information (some would consider this as junk). ExtraView will now be more aggressive in cleaning out this information, leading to a better presentation of the mail once it has been imported into ExtraView.
253435	Product Bug	7.0.4	General code issues	Could not use the sign on page 'Change Password' functionality with the Alternate User ID	The change password utility offered from the sign on page only understood the primary User ID, not the Alternate User ID. The utility now supports both.
256185	Product Bug	7.0.4	General code issues	Latency issues with client site after upgrade - inefficient handling of allowed values when localization is turned on	On sites where there were a large number of allowed value combinations and localization was turned on, there was a delay in loading the Add and Edit screens. This has been resolved.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
254879	Product Bug	7.0.4	Jira Integration	Jira integration caused repetition of log area fields while failing to upload file attachments	The LOG_AREA_TEMPLATE behavior setting must be set to the default value of "\$\$LA_DATE\$\$ \$\$LA_USER\$\$" in order for the log area header lines to not be propagated from ExtraView to JIRA records. In addition, Jira has a very low limit on the size of attachments and it does not handle large attachment files gracefully. ExtraView now does extra checking in the integration to overcome this problem in Jira.
254866	Product Bug	7.0.4	Notification	Errors in logs generating email notifications	This did not result in any incorrect processing, but the errors in the logs are now handled so they do not appear. There was no functional problem.
253251	Product Bug	7.0.4	Search / Report	Incorrect display of totals in a report that combined repeating rows and group headers	When repeating row fields were used as group headings on a column report, the same group heading could be repeated more than once, out of sequence. This caused the same record to be repeated on the report. At the same time, the count of records in the group would be incorrect. This has been fixed.
253380	Product Bug	7.0.4	Search / Report	Timezone Issue with Report Scheduler	Scheduled reports were being sent to some users twice. The cause was that the time zone of the administrator running the scheduled report was different than the user who was receiving the scheduled report. The application has been changed to use the time zone of the user receiving the report, as opposed to using the time zone of the administrator who set up the report schedule.
254552	Product Bug	7.0.4	Search / Report	Quickfind task throwing error	This was a bug in the embedded Apache Lucene library. Problem fixed by moving from Lucene 3.4 to Lucene 3.6
254769	Product Bug	7.0.4	Search / Report	Data was not displayed for some records when historic data filter queries were applied to report criteria filter	The HIST_RANGE_START and HIST_RANGE_END filters were not operational for these reports. This has been fixed.
256079	Product Bug	6.6.5	Search / Report	Problem with greater than 1,000 PROJECTS within a single AREA in an installation	This problem was localized and resolved.
Count: 22 records
